Loss Prevention Analytics

Loss Prevention Analytics (LPA) is a cloud-based loss prevention solution revolutionizing the way retailers manage their operations. It provides a clear view of a retailer's operations and verifiable proof of errors and theft.

LPA works by combining different sources of information, such as transactional and video data. Then, it analyzes this information and sets rules to produce documentation and reports for prevention, early detection, and investigation.

Key Features

- Automatic identification of high-risk transactions
- Real-time video streaming from your desktop or CStoreOffice mobile app
- Filter video by date, location, employee, item, event, and type of transaction
- Pair with CStoreOffice for additional functionality

Key Benefits

- Reduce shrink up to 60%
- Ensure age- and time- restricted sales compliance
- Remotely monitor your stores
- Reduce vendor, employee, and customer theft
- Improve training and internal controls on restricted sales

“Loss Prevention Analytics is an amazingly helpful feature to learn much more about your store operations than you probably want as it will show you all critical transactions where owners usually lose money.

Iryna Maskaliova,
